

March 22 2021

THE SECOND YEAR OF THE BULL MARKET BEGINS

Ryan Detrick, CMT, *Chief Market Strategist, LPL Financial*

Jeff Buchbinder, CFA, *Equity Strategist, LPL Financial*

The bear market ended one year ago this week, finishing one of the fastest and most vicious bear markets of all-time—one that led to a drawdown of 34%. Things have come full circle now, as stocks have staged a furious rally, with new highs happening across the globe as the economy recovers at a record pace. We take a look back at what happened last March, while also examining how previous bull markets did during the second year of their existence.

A LOOK BACK

Although we aren't sure we want to, let's take a look back at the bear market and try to put in perspective just how historic and devastating it was for investors, while also pointing out some incredible positives. Here are five amazing stats to summarize the bear market and bounce back:

- **Fastest bear market ever.** Although it was only a one-month-long bear market, the S&P 500 Index fell 33.9% from the February 19, 2020 peak until the March 23, 2020 low. Along the way, it set the record for the fastest 20% bear market ever (only 16 days, topping the previous record from 1929).
- **March 16, 2020.** This day will go down in history as one of the worst days ever for stocks. The Dow Jones Industrial Average fell 12.9%, which was the fourth-worst day in the nearly 125-year history of the Dow. Only the crash of 1929, crash of 1987, and the day that trading started (after being halted for months) during World War I were worse than March 16, 2020.
- **The most volatile month ever.** Huge swings (both up and down) were quite common in March 2020. In fact, looking at the Dow, the average daily move (up or down) during March 2020 was an astounding 5.3% per day. The previous record was 3.9% during November 1929, again showing just how March 2020 was like nothing we've ever seen before.
- **The bounce back was even more impressive.** After falling nearly 34%, it took only five months for the S&P 500 to recover its losses, the fastest bounce back ever for a 30% loss or greater. To put it in perspective, the S&P 500 also lost 34% in 1987, but that recovery took 20 months to get back to new highs.
- **From red to green.** At the lows in 2020, the S&P 500 was down 30.7% for the year, but when all was said and done it closed up 16.3%. This was the first year in history stocks were down 30% at one point during the year and finished the year in the green.

NOW WHAT? THE BULL TURNS TWO

Incredibly, the S&P 500 has increased more than 74.9% since the lows a year ago (as of March 19, 2021), making it the best start to a bull market ever. After such a strong first year, where might this bull market go in its second year?

Figure 1 shows what happened during the first year and second year of bull markets that followed 30% or larger bear markets going back to World War II. Here are three takeaways to remember as the bull turns the calendar to year two.

- Since World War II, there have been six other bear-market declines of at least 30%, and in every single case the S&P 500 was up firmly the first year of a new bull market—with an average return of more than 40%. The good news is the gains continued in year two, as stocks were also up the second year of a new bull market every single time—up a solid 16.9% on average. Only once (after the 1987 crash) did stocks gain more during year two than year one.
- The previous best start to a bull market ever was the 2009 bull market, which was up 68.6% after one year. Even after those historic one-year gains, the S&P 500 managed to gain a respectable 15.9% during the second year. It wasn't an easy ride, however, as there was a 17.1% correction during the second year.
- Pullbacks tend to happen during the second year of a new bull market, with an average year two pullback of 10.2%. Considering the current bull market reflected the best start to a bull market ever, this could open the door for an above-average pullback during year two.

NEW BULL MARKETS HISTORICALLY BUILD ON YEAR ONE GAINS IN YEAR TWO

S&P 500 Index Performance Following >30% Bear Market Bottoms

REITERATE OUR BULLISH VIEW

This bull market is off to an amazing start, but it is important to remember it is still young. While a pickup in volatility would be normal as this stage of a strong bull market, we think suitable investors may want to consider buying the dip. Vaccine distribution, fiscal and monetary stimulus, and a robust economic recovery all have our confidence high.

COVID-19 still presents lingering near-term risk, with variants of the virus adding to the worry. Additional sharp and swift moves higher in interest rates could potentially cause valuations to contract meaningfully, though we see that as unlikely. We continue to expect higher interest rates to fade as a concern for the bull market, but it may take a bit more time to reach that point.

We continue to recommend an overweight-to-equities and underweight-to-fixed-income stance relative to investors' targets, as appropriate. We reiterate our S&P 500 Index fair value target range of 4,050–4,100 at year-end 2021, based on a price-to-earnings (PE) multiple near 21, and our 2022 earnings forecast of \$195.

IMPORTANT DISCLOSURES

US Treasuries may be considered "safe haven" investments but do carry some degree of risk including interest rate, credit, and market risk. Bonds are subject to market and interest rate risk if sold prior to maturity. Bond values will decline as interest rates rise and bonds are subject to availability and change in price.

The Standard & Poor's 500 Index (S&P500) is a capitalization-weighted index of 500 stocks designed to measure performance of the broad domestic economy through changes in the aggregate market value of 500 stocks representing all major industries.

The PE ratio (price-to-earnings ratio) is a measure of the price paid for a share relative to the annual net income or profit earned by the firm per share. It is a financial ratio used for valuation: a higher PE ratio means that investors are paying more for each unit of net income, so the stock is more expensive compared to one with lower PE ratio.

Earnings per share (EPS) is the portion of a company's profit allocated to each outstanding share of common stock. EPS serves as an indicator of a company's profitability. Earnings per share is generally considered to be the single most important variable in determining a share's price. It is also a major component used to calculate the price-to-earnings valuation ratio.
